Patent No. 5814478

GENERAL INFORMATION:

APPLICANT: Valenchela, et al.

TITLE OF INVENTION: NOVEL TYROSINE KINASE RECEPTORS

TITLE OF INVENTION: AND LIGANDS

NUMBER OF SEQUENCES: 32

CORRESPONDENCE ADDRESS:

ADDRESSER: Regeneron Pharmaceuticals, Inc.

STREET: TAITYCOWN

STREET: TAITYCOWN

COUNTRY: USA

ZIP: 10591

COMPUTER READABLE FORM:

MEDIUM TYPE: Diskette

COMPUTER: IBM Compatible

COMPUTER: IBM Compatible

COMPUTER: BABLOS Version 2.0

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/644,271

FILING DATE: 10-DEC-1995

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 30,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 3

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an assay for the diagnosis or assessment of the averity of osteoarthritis or rheumatoid arthritis. The assay involves measuring (in a biological sample) the amount or presence of an isomerised or optically inverted protein or one or more isomerised or optically inverted from proteins such as perlecan, biglycan, decorn, fibrillin-l or protocadherin. The assay is useful for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The present sequence is human perlecan protein

Amino acid sequence of a human protein. protein; 4393 AAB31889 standard; RESULT 2

Human, perlecan, retinol-binding plasma protein, calgranulin B, vaccine, ganglioside GM2 activator; saposin B; degenerative disease, glial cell; neurological disease, auto-immune disease; multiple sclerosis; toxicity; Alzheimer's disease, Parkinson's disease; amyotrophic lateral sclerosis; rheumatoid polyarthritis; lupus erythematosus; gene therapy.

17-JUL-2000; 2000WO-FR002057 25-JAN-2001

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymolectide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the genglioside GMZ activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polymucleotides and polypeptides are used for diagnosis, prognosis, polymucleotides and polypeptides are used for diagnosis, prognosis, on prevention and treatment of multiple sclerosis (in its various forms and parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisenses sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells IPKAGLSSGFIGCVRELRIQGEEIVFHDLNLTAHGISHCPTCRDRPCONGGOCHDSESSS 3868 4048 4108 240 300 420 9 3749 RHPTPLALGHFHTVTLLRSLTQGSLIVGDLAPVNGTSQGKFQGLDLNEELYLGGYPDYGA RHPTPLALGHFHTVTLLRSLTQGSLIVGDLAPVNGTSQGKFQGLDLNEELYLGGYPDYGA 3869 YVCVCPAGFTGSRCEHSQALHCHPEACGPDATCVNRPDGRGYTCRCHLGRSGLRCEEGVT 3929 VITPSLSGAGSYLALPALTNITHHELRLDVEFKPLAPDGVLLFSGGKSGPVEDFVSLAMVG 1 BIKITFRPDSADGMLLYNGOKRVPGSPTNLANROPDFISFGLVGGRPEFRFDAGSGMATI VTTPSLSGAGSYLALPALTNTHHELRLDVEFKPLAPDGVLLFSGGKSGPVEDFVSLAMVG 3989 GHLEFRYELGSGLAVIRTAEPLALGRWHRVSAERLINKOGSLRVNGGRPVIRSSPGKSOGL PCERQPCQHGATCMPAGEYEPQCLCRDGIKGDLCEHEENPCQLREPCLHGGTCQGTRCLC LPGFSGPRCQQGSGHGIAESDWHLEGSGGNDAPGOYGAYFHDDGFLAFPGHVFSRSLPEV IPKAGLSSGFIGCVRELRIQGEEIVFHDLNLTAHGISHCPTCRDRPCQNGGQCHDSESSS YVCVCPAGFTGSRCEHSQALHCHPEACGPDATCVNRPDGRGYTCRCHLGRSGLRCEEGVT GHLEFRYELGSGLAVLRSAEPLALGRWHRVSAERLNKDGSLRVNGGRPVLRSSPGKSQGL NLHTLLYLGGVEPSVPLSPATNMSAHFRGCVGEVSVNGKRLDLTYSFLGSOGIGOCYDSS NEHTLLYLGGVEPSVPLSPATNMSAHFRGCVGEVSVNGKRLDLTYSFLGSQG1GQCYDSS PCERQPCQHGATCMPAGEYEFQCLCRDGFKGDLCEHEENPCQLREPCLHGGTCQGTRCLC LPGFSGPRCQQGSGHGIAESDWHLEGSGGNDAPGQYGAYFHDDGFLAFPGHVFSRSLPEV . 0 Length 4393; Indels DB 4; Score 3815; DB 4; Pred. Sequence 4436 AA;

```
The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abstrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and to amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the way.

                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a human polypeptide, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymorleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GMZ activator, calgranulin B or saposin B protein the ganglioside GMZ activator, calgranulin B or saposin B protein camples activation of the ganglioside GMZ activator, calgranulin B or saposin B protein camples and polypeptides are used for diagnosis, prognosis, polymucleotides and polypeptides are used for diagnosis, prognosis, proposition and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and phases). They may also be useful in cases of e.g. Alzheimer's and parkinson's diseases, amyotrophic lateral sclerosis, rheumatcid parkinson's diseases, amyotrophic lateral sclerosis, rheumatcid per therapy (expression of sense or antisenses sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  690

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .620 RKGALRVGDGPRVLGBSPVPHTVINLKEPLYVGGAPDFSKLARAAAVSSGFDGAIQLVSL 1679
proteins, and the polynucleotide sequences encoding them. The NOVX proteins of the invention are G-protein coupled receptor (GPCR) related proteins. The sequences of the invention are useful in the manufacture of a medicament for treating a syndrome related to a human disease associated with the polypeptides e.g. cancer. ABUS2311-ABUS2408 represent the human NOVX proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                       1505

particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with a human disease, which includes a pathology associated with NoVX polypeptide is particularly useful for treating, preventing or alleviating pathology associated with NoVX polypeptide are especially useful for treating or preventing e.g. polypeptide in a mammal, e.g. a human. The NoVX nucleic acid and clabetes, obesity, cancers (e.g. lymphoma, uterus cancer or prostate cancer), dyslipidemias, anorexia, wasting disorders, Alzheimer's disease, Parkinson's disorder, cachesia, cardiomyopathy, AIDS, asthma, Tcohn's disease, multiple sclerosis, hypertension, atherosclerosis, hemophilia, graft-versus-host disease or Albright hereditary osteodystrophy. The DNA encodung the protein is useful in gene therapy for treating the above conditions. These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic impolications. This sequence represents one of the NOVX proteins of the

The invention relates to new isolated NOVX polypeptides, the genes encoding them or sequences having at least 95% identity to the amino acid cor nucleotide sequences. The NOVX polypeptide is useful as a therapeutic, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a parthology associated with nucleous and the sequences. The NOVX polypeptide is particularly useful for treating, preventing or alleviating pathology associated with NOVX polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and confishers, obsesty, cancers (e.g. imphoma, uterus cancer or prostate cancer), dyslipidemias, anorexia, wasting disorders, Alzheimer's disease, parkinson's disorder, cachecial, cardiomypathy, AIDS, asthma. Crohn's disease, multiple solerosis, hypertension, atherosolerosis, hemophilia, caracting the protein is useful in gene therapy for treating the above conditions. These are also useful in quelloping powerful assay system for applications. This sequence represents one of the NOVX proteins of the
   New NOVX polypeptides and polynucleotides, useful in gene therapy, particularly for treating or preventing a syndrome associated with human disease e.g. diabetes, obesity, cancer, Alzheimer's disease, hypertension or hemophilia.
                                                                                                                                       Claim 1; SEQ ID NO 106; 748pp; English.

The present sequence is the protein sequence of Incyte polypeptide

2736276CD1 denoted human cell adhesion and extracelular matrix protein 8

(CADECM-8). The protein is encoded by a clone isolated from a soft tissue tumour cDNA library. The invention provides CADECM-1 to -11 polypeptides

(See ABP58224-34) and polynucleotides (see AB224578-88), vectors, host cells, antibodies, asponists and antagonists. These are useful for diagnosing, treating or preventing disorders associated with aberrant expression of CADECM, particularly cell proliferative disorders (e.g. arteriosclerosis, atheorosclerosis, cirrhosis, hepatitis, paroxysmal nocturnal heemoglobiuuria, polycythaemia vera, psoriasis, primary thromobocytopaenia or cancer), developmental disorders (e.g. renal nocturnal namemia or mental retardation), neurological disorders (e.g. Alzheimer's disease, Parkinson's disease or epilepsy), reproductive disorders (e.g. infertility or a disruption in the menstrual cycle), or autoliditis, contact dermatitis, Crohn's disease, diabetes mellitus, glomenlonephritis, Goodpasture's syndrome, glout, Graves' disease, Hashinco's thyroiditis, irritable bowel syndrome, multiple sclerosis, fundal, osteoarthritis, osteoarthritis, or viral, bacterial, fungal, parasitic, protozoal or helminthic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          230

The invention relates to a novel isolated human neurotransmission-associated proteins (NTRAN) polypeptide. The polypeptide of the invention demonstrates oyrostatic and immunomodulator activities and may be useful for preparing a composition for diagnoshing or treating a disease or condition associated with decreased expression or overexpression of functional NTRAN including immune disorders or cancer, as well as during gene therapy procedures. The current sequence is that of the human NTRAN protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human neurotransmission-associated proteins (NTRAN) polypeptide, useful for preparing a composition for treating a disease associated with decreased expression or overexpression of NTRAN e.g., cancer.

```
The present invention provides the protein and coding sequences of cDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a polypeptide of the invention
                                                                                                                                     New polynucleotides and polypeptides encoded by the polynucleotides isolated from skin cells, useful for treating skin wounds, cancers, growth and developmental defects, inflammatory diseases, or for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences Genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), proteins (ABB57737-ABB72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          477
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     836
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         896
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    486
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        492
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             481
                                                                                                                                                                                                                                                                                       9
                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophilar. The invention iseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL30512), a expressed DNA ABBR2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part of the from WIPO at ftp.wipo.int/pub/published_pot_sequences

                                                                                                                                          This polypeptide comprises the amino acid sequence of human agrin deduced from an isolated foetal brain cDNA clone (see ART9041). Pull-length agrin, or active portions of it, can be expressed using a claimed host-vector system. The agrin polypeptides can be used in claimed methods treating diseases or disorders that affect muscle, especially atrophy resulting from demervation due to nerve trauma, degenerative, metabolic or inflammatory neuropathy, peripheral neuropathy or damage to nerves caused by environmental toxins or drugs. In particular the muscle atrophy is due to motor neuronopathy, chronic disuse, metabolic stress or nutritional insufficiency, muscular dystrophy syndrome, congenital myopathy or acquired (toxic or inflammatory) myopathy. The polypeptides can also be used in a claimed method of promoting the growth, differentiation or survival of cells that express muscle-specific (MuSK) receptors (see AAM26610-11), and to raise antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               18;

```

The invention relates to new isolated NOVX polypeptides, the genes encoding them or sequences having at least 95% identity to the amino acid or nucleotide sequences. The NOVX polypeptide is useful as a therapeutic, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide is particularly useful for treating, preventing or alleviating pathology associated with NOVX polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and polypeptide in a mammal, e.g. a human, the NOVX nucleic acid and diabetes, obesity, cancers (e.g. lymphoma, uterns cancer or prostate cancer), dyslipidemias, anorexia, wasting disorders, Alzheimer's disease, parkinson's disorder, cachesta, cardenomyopathy, AIDS, asthma, Crohn's parkinson's disorder, cachesta, cardenomyopathy, AIDS, asthma, Crohn's graft-versus-host disease or Albright hereditary osteodystrophy. The DNA conditions. These are also useful in gene therapy for treating the above conditions. These are also useful in descipening powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. This sequence represents one of the NOVX proteins of the invention.

The invention discloses a polymuclectide comprising a sequence selected from 1970 fully defined nuclectide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polymuclectide or its partial peptide, an antibody binding to the polypeptide or peptide of the polymuclectide by contacting the polypeptide or peptide of the polymuclectide by contacting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polymuclectide in an expressible manner and an antisense polymuclectide. The oligonuclectide is useful as a primer for synthesishing the polymuclectide, or as a probe for detecting the polymuclectide. The polymuclectide, or as a probe for detecting the polymuclectide. The polymuclectide many disease-related genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of genes may be more an encoded in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of genes and manner are involved in tissue and/or cell regeneration. Membrane proteins, disease-related proteins, transcription related proteins, disease-related proteins and genes are involved in tissue and/or cell transcription or the developing a dispasse related proteins.
Human, pharmaceutical, diagnostic, gene therapy, tissue regeneration, cell regeneration, membrane protein, signal transduction-related protein, transcription-related protein, osteoporosis, neurological disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ishii S;

-!- FUNCTION: This protein is an integral component of basement membranes. It is responsible for the fixed negative electrostatic charge and is involved in the charge-selective ultrafiltration properties. It serves as an attachment substrate for cells.
-!- SUBUNIT: Purified perlean has a strong tendency to aggregate in dimers or stellate structures. It interacts with other basement membrane components such as laminin, prolargin and collagen type

- I FUNCTION: This protein is an integral component of basement membranes. It is responsible for the fixed negative electrostatic charge and is involved in the charge-selective ultrafiltration properties. It serves as an attachment substrate for cells.
- SUBMINT: Purified perlecan has a strong tendency to aggregate in dimers or stellate structures. It interacts with other basement membrane components such as laminin, prolargin and collagen type
                                                               9

-!- TISSUE SPECIFICITY: Found in the basement membranes.
-!- PTM: CONTAINS THREE HEPARAN SULFATE CHAINS AS WELL AS N-LINKED AND O-LINKED OLIGOSACCHARIDES.
-!- SIMILARITY: Contains 4 LDL-receptor class A domains.
-!- SIMILARITY: Contains 11 laminin EGF-like domains.
